

INSTALLATION INSTRUCTIONS FOR:

REL-1 SERVO RELAY DECK

Secure the relay deck to the airframe or simply tie it onto a bundle of wires using nylon straps, etc.

Wire according to **DIAGRAM 1** if you are installing a SPDT switch and one servo. Refer to **DIAGRAM 2** if you are using a ROS-4 4-way switch. Refer to **DIAGRAM 3** if you are using relays with a RAC stick grip.

The relays are rated at 1 amp. Fuses and circuit breakers are not included, but are highly recommended for all installations.

Test to determine if the servo(s) run in the direction that you desire. This direction can be changed by reversing the two white wires that connect the servo to the relay deck.

CAUTION!! Be careful that the two white wires running to the servo do not touch ground or short together. Do not power the relays with less than 12 VDC. The relays will become unreliable when powered with anything other than 12-14 VDC. Do not power the relays with a battery charger.
